

root weevil was first identified in an orchard on Hobbs
Expressive North of McAllen in October 2003 (Texas Center
Newsletter, Dec. 2003). A second *Diaprepes* find was
in a nearby orchard on Northgate Road. Both orchards
and 18 residential properties within a 300 yard radius
are under a strict quarantine enforced by the Texas Dept.
of Agriculture. Both orchards are being sprayed in the
spring and late summer with a tank mix of captan +

citrus spray oil. The foliar spray kills adult weevils and
emerging larvae (neonates). Capture ELU is also being
applied twice per season beneath the tree canopy to kill
neonates as they emerge from the soil. Citrus, palms, shrubs
and ornamentals in the quarantined residential sites are
also receiving two applications per season of
Sevin 8US or Carbaryl 4L and two ground barrier appli-
cations of Talstar granules or Talstar 10WP drench
sprays. All residential treatments are by licensed pest

management.

Twenty Tedders Traps placed in each orchard and
3-4 per residential site are being monitored weekly for
emerging *Diaprepes* neonates.

2002-2003

The most critical need for water will occur during the next two months as fruit is being determined. Normal conditions that have prevailed through both February and March have both delayed the onset of fruit set. For example, Valencia orange fruit set peaks in late February, while grapefruit set peaks in March, with grapefruit

ry month, with the highest
December (Figure 2).
